

In April 2024, I decided to give Virus Shield Disinfectant a try. My goal was to see how it stacked up against other disinfectants on the market, specifically for use as a whelping disinfectant. I was looking for a product that could help maintain a clean and safe environment for my dogs, particularly a mother and her litter of seven puppies.

During this time, I used Virus Shield Disinfectant for the daily cleaning of the whelping box's interior walls and made it a point to regularly spray the mother's teats, especially after her trips outside. I was keen to see if this product would help reduce the risks of infections, stomach upsets, and mastitis.

From April to July 2024, I am happy to report that the puppies thrived without any signs of stomach upsets, diarrhoea, or vomiting. The mother also remained healthy, with no instances of mastitis. Given that the puppies were delivered via a caesarean section, I believe that the Virus Shield Disinfectant played a crucial role in keeping the section wound clean and free from

infection. The disinfectant's application on the mother's teats surrounding the wound helped maintain a sterile environment, which I believe contributed to the wound's excellent condition.

I am thoroughly impressed with Virus Shield Disinfectant and would not hesitate to use it again in a whelping environment. The ability to use it liberally within the whelping box and directly onto the mother's teats without worrying about the puppies ingesting harmful chemicals is a significant advantage. It's reassuring to have a powerful disinfectant that ensures strict cleanliness during such a vulnerable period, without compromising the health and safety of the puppies.
